

1.1.3. Age and Salary Calculation Write a Python program that reads the birth date and salary of employees. Input Format: The input consists of: A string representing the birth date of the employee in the format DD - MM - YYYYY.

Output Format:

The output should include:

The age of the employee.

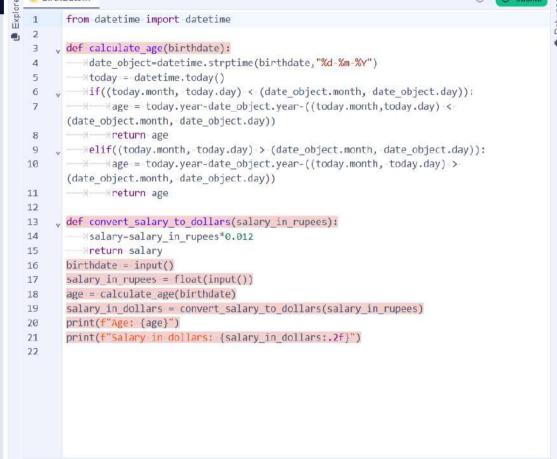

The salary of the employee in dollars.

A floating-point number representing the salary of the employee in rupees.

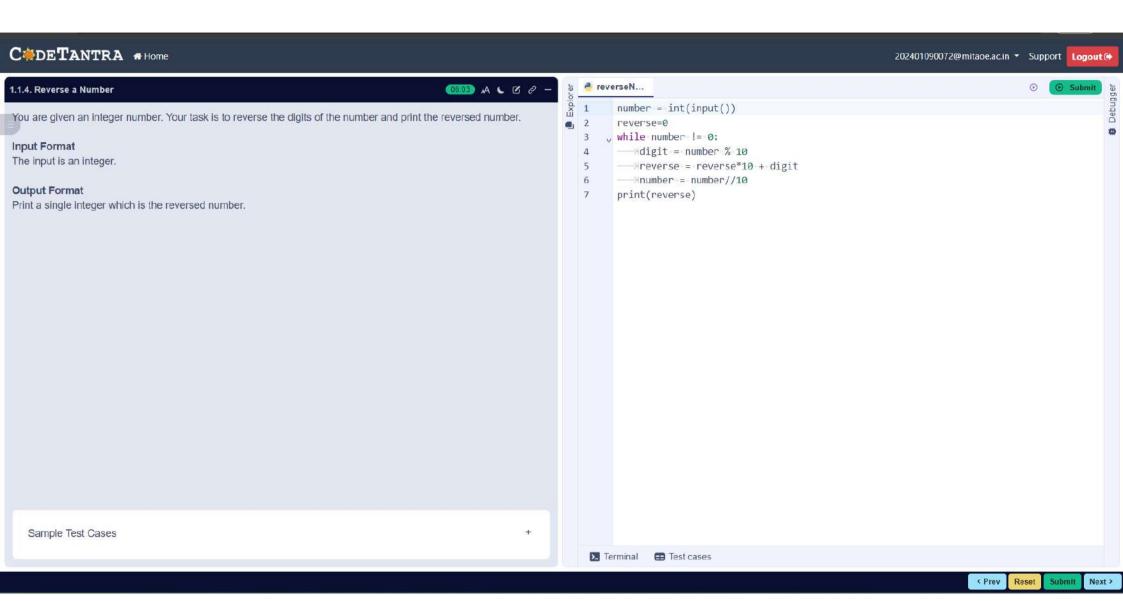

Note:

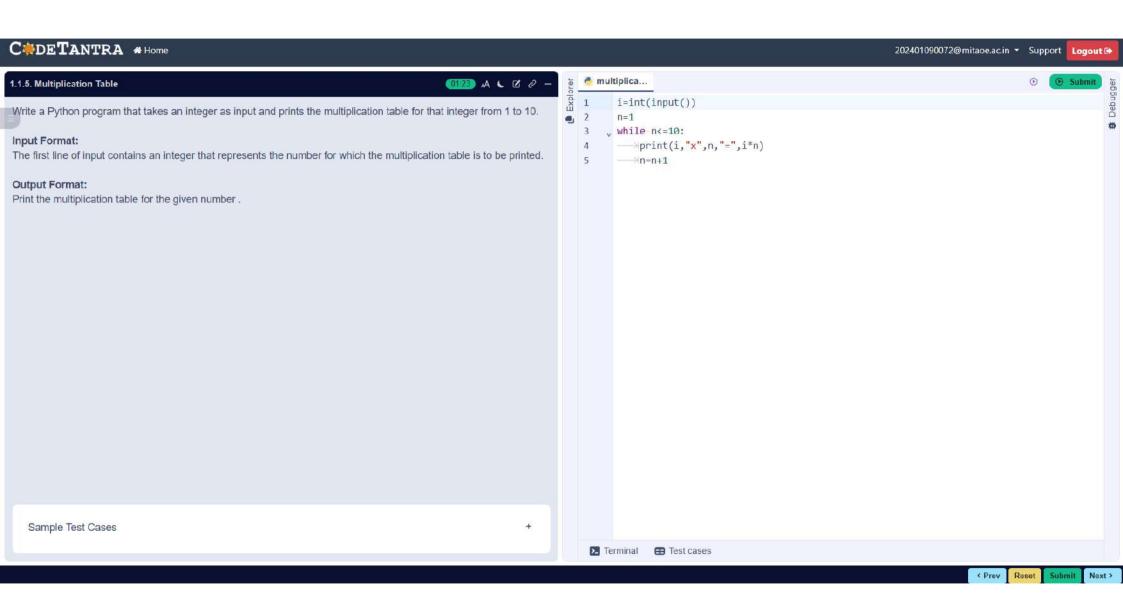

1INR=0.012USD

Sample Test Cases

< Prev

Output Format:

If the student passes all courses:

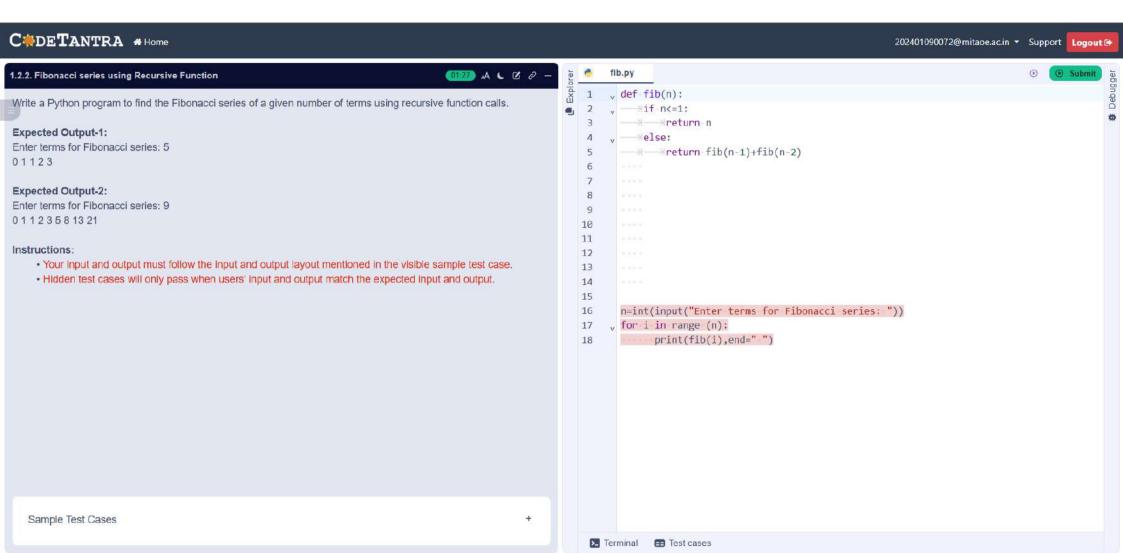

- · Print the aggregate percentage (rounded to two decimal places).
- Print the grade based on the aggregate percentage.

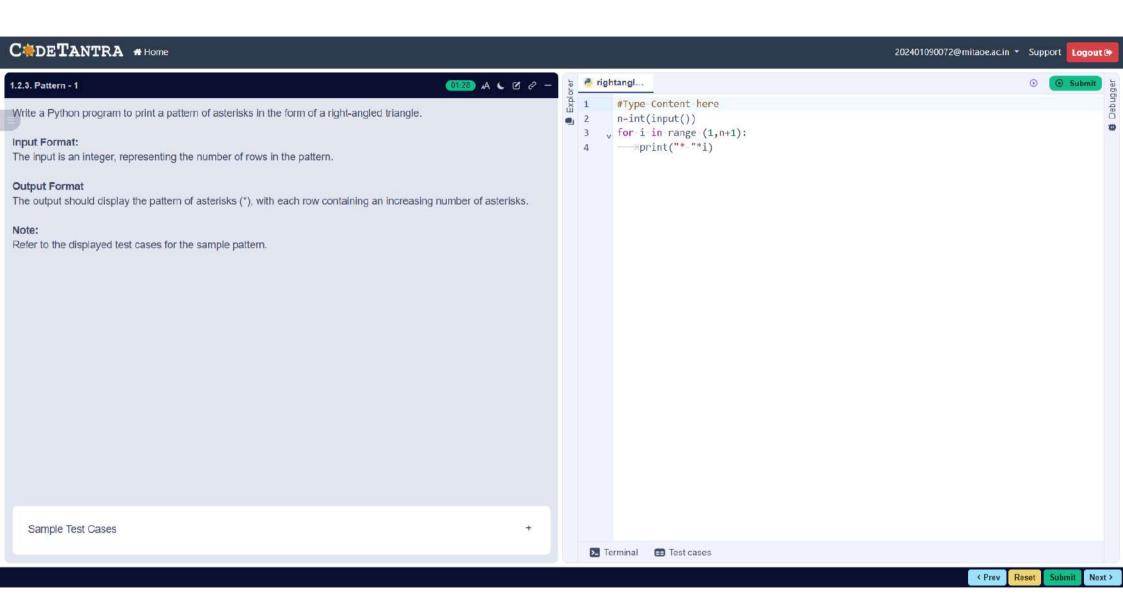

If the student fails any course (marks < 40 in any course), print:

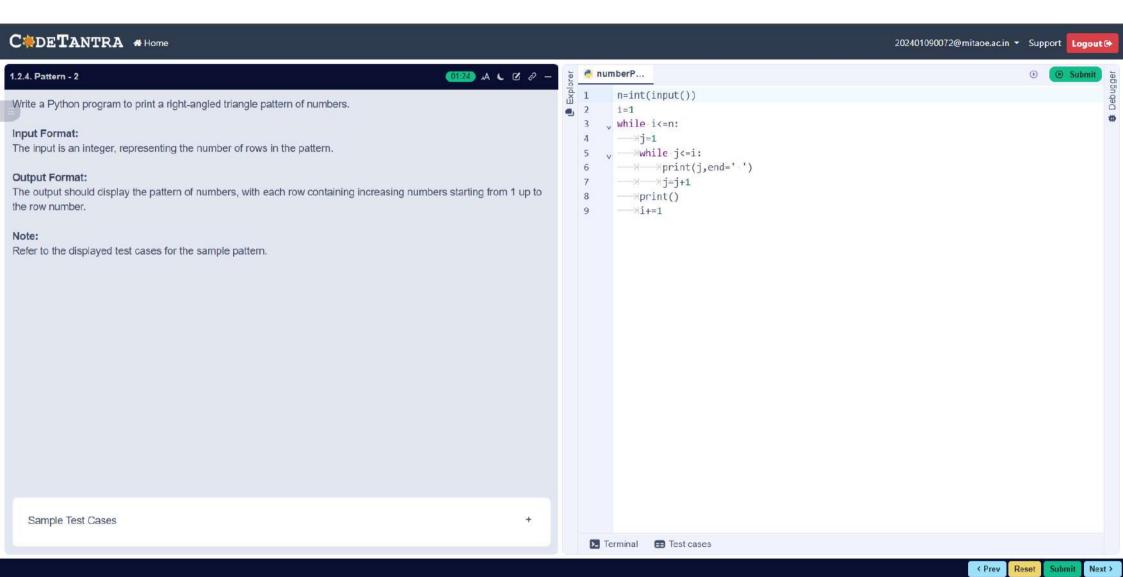

· "Fail".

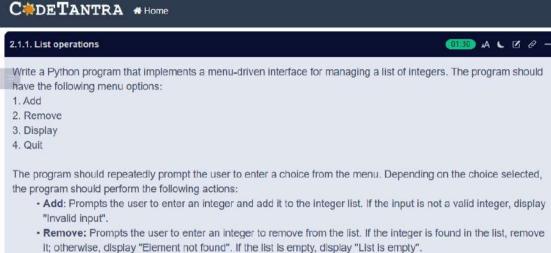

Sample Test Cases

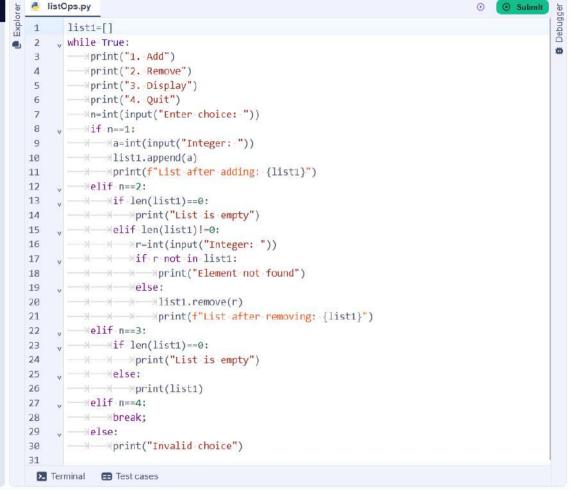

- · Display: Displays the current list of integers. If the list is empty, display "List is empty".
- · Quit: Exits the program.
- . The program should handle invalid menu choices by displaying "Invalid choice". Ensure that the program continues to prompt the user until they choose to guit (option 4).

Sample Test Cases

2.1.2. Dictionary Operations

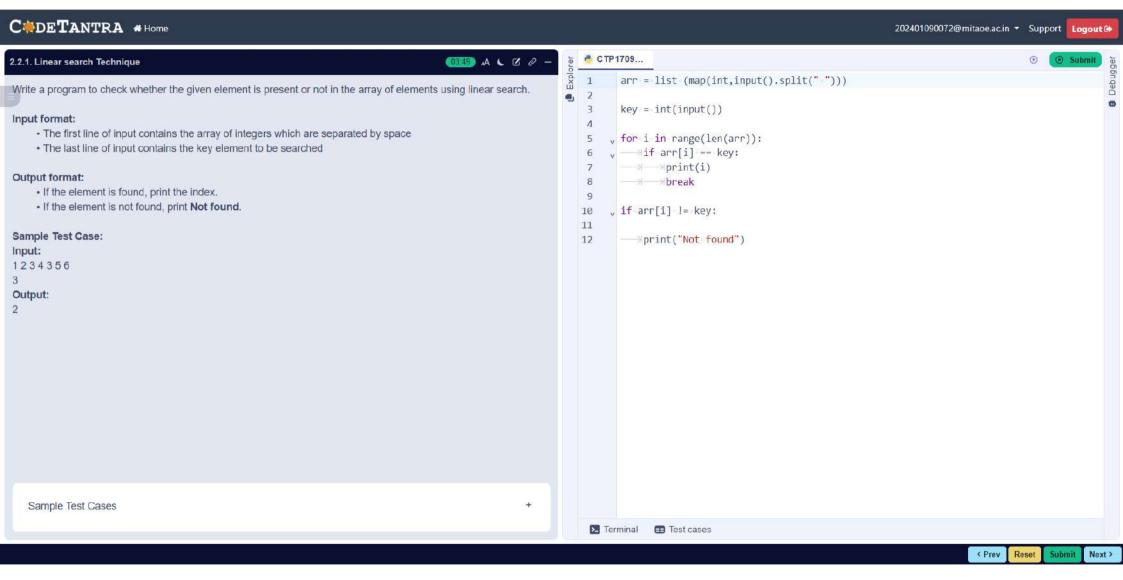

Write a Python program to perform the following dictionary operations:

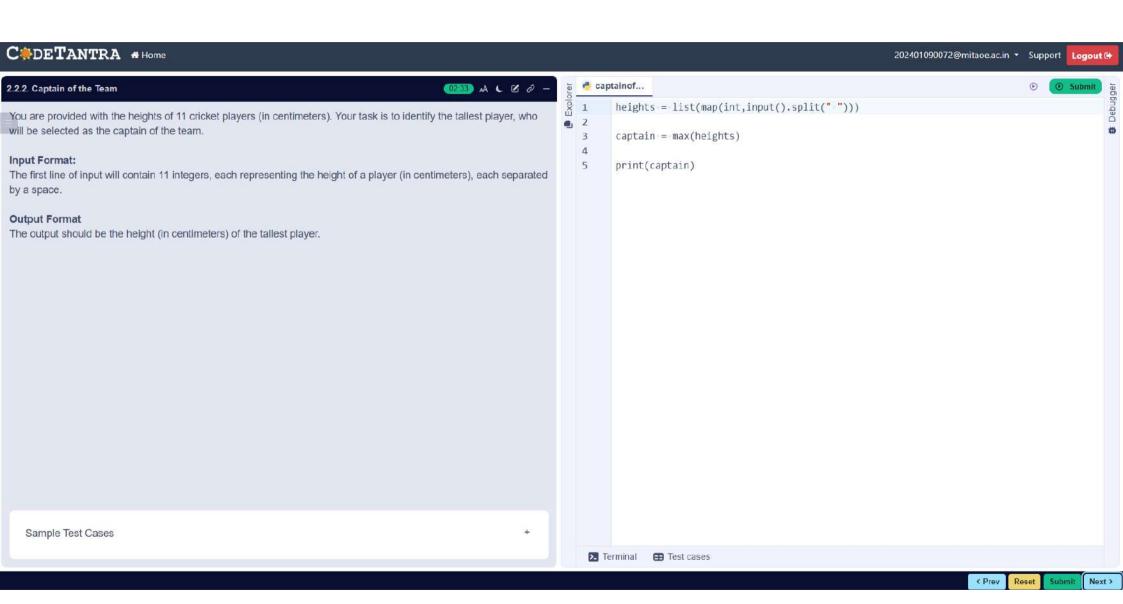

- Create an empty dictionary and display it.
- · Ask the user how many items to add, then input key-value pairs.
- . Show the dictionary after adding items.
- · Ask the user to update a key's value. Print "Value updated" if the key exists, otherwise print "Key not found".
- · Retrieve and print a value using a key. If not found, print "Key not found".
- Use get() to retrieve a value. If the key doesn't exist, print "Key not found".
- Delete a key-value pair. If the key exists, delete and print "Deleted". If not, print "Key not found".
- · Display the updated dictionary.

Note: Refer to visible test cases.

- Input Format:

 User inputs the number of rows and columns with space separated values.
 - User inputs elements of the array row-wise followed line by line, separated by spaces.

Output Format:

- . The created NumPy array based on the input dimensions and elements.
- · Dimensions (ndim): Number of dimensions of the array.
- · Shape: Tuple representing the shape of the array (number of rows, number of columns).
- · Size: Total number of elements in the array.

Note: Use reshape() function to reshape the input array with the specified number of rows and columns.

3.2.1. Numpy: Matrix Operations

The given code takes two 3×3 matrices, matrix_a, and matrix_b, as input from the user and converts them into NumPy arrays.

Task:

You are required to compute and display the results of the following matrix operations:

- 1. Addition (matrix_a + matrix_b)
- 2. Subtraction (matrix_a matrix_b)
- 3. Element-wise Multiplication (matrix_a * matrix_b)
- 4. Matrix Multiplication (matrix_a · matrix_b)
- 5. Transpose of Matrix A

Input Format:

- The user will input 3 rows for matrix_a, each containing 3 integers separated by spaces.
- Similarly, the user will input 3 rows for matrix_b, each containing 3 integers separated by spaces.

Output Format:

The program should display the results of the operations in the following order:

- 1. The result of Addition.
- 2. The result of Subtraction.
- 3. The result of Element-wise Multiplication.
- 4. The result of Matrix Multiplication.
- 5. The Transpose of Matrix A.

Sample Test Cases

You are given two arrays A and B. Your task is to complete the function array operations, which will convert these lists into NumPy arrays and perform the following operations:

1. Arithmetic Operations:

- Compute the element-wise sum, difference, and product of the two arrays.
- 2. Statistical Operations:
 - · Calculate the mean, median, and standard deviation of array A.
- 3. Bitwise Operations:
 - Perform bitwise AND, bitwise OR, and bitwise XOR on the arrays (ex: A. OR B.).

Input Format:

- . The first line contains space-separated integers representing the elements of array A.
- The second line contains space-separated integers representing the elements of array B.

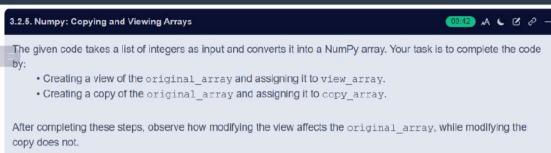

Output Format:

· For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as shown in sample test cases.

Sample Test Cases

- A single line of space-separated integers.

Output Format:

· After modifying the view:

Original array after modifying view: <original_array>
View array>

- After modifying the copy:

Original array after modifying copy: <original_array>
Copy array: <copy_array>

Sample Test Cases

The given code in the editor takes a single array, array1, as space-separated integers as input from the user. Additionally, it takes the following inputs:

- · search value: The value to search for in the array.
- · count value: The value to count its occurrences in the array.
- · broadcast value: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

- 1. Searching: Find the indices where search value appears in array1 and print these indices.
- 2. Counting: Count how many times count value appears in array1 and print the count.
- 3. Broadcasting: Add broadcast value to each element of array1 using broadcasting, and print the resulting
- 4. Sorting: Sort array1 in ascending order and print the sorted array.

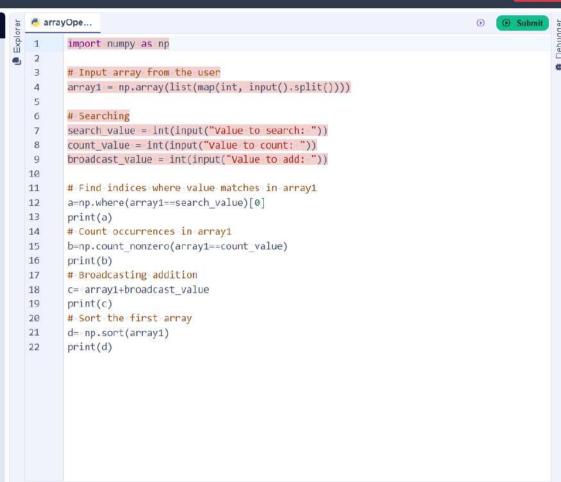

Input Format:

- 1. A single line containing space-separated integers representing array1.
- 2. An integer search value represents the value to search for in the array.
- 3. An integer count value represents the value to count in the array.
- 4. An integer broadcast value represents the value to add to each element of the array.

Output Format:

- 1. The indices where search value occurs in array1.
- 2. The count of occurrences of count value in arrayl.
- 3. The array after adding the broadcast value to each element.
- 4. The sorted array.

their marks in three subjects as input, reads the data, and performs the following operations: - Print all student details: Display the complete details of all students, including roll numbers and marks for all subjects.

- Find total students: Determine the total number of students in the dataset.
- · Print all student roll numbers: Extract and print the roll numbers of all students.
- Print Subject 1 marks: Extract and print the marks of all students in Subject 1.
- Find minimum marks in Subject 2: Identify the lowest marks in Subject 2.
- Find maximum marks in Subject 3: Identify the highest marks in Subject 3.
- · Print all subject marks: Display the marks of all students for each subject.
- · Find total marks of students: Compute the total marks for each student across all subjects.
- · Find the average marks of each student. Compute the average marks for each student.
- Find average marks of each subject: Compute the average marks for all students in each subject.
- Find average marks of Subject 1 and Subject 2: Compute the average marks for Subject 1 and Subject 2.
- Find average marks of Subject 1 and Subject 3: Compute the average marks for Subject 1 and Subject 3:
- Find the roll number of the student with maximum marks in Subject 3: Identify the student with the highest marks in Subject 3 and print their roll number.
- · Find the roll number of the student with minimum marks in Subject 2: Identify the student with the lowest marks in Subject 2 and print their roll number.
- · Find the roll number of students who scored 24 marks in Subject 2: Identify students who obtained exactly 24 marks in Subject 2 and print their roll numbers.
- · Find the count of students who got less than 40 marks in Subject 1: Count the number of students who scored less than 40 marks in Subject 1.
- Find the count of students who got more than 90 marks in Subject 2: Count the number of students who scored more than 90 marks in Subject 2.
- Find the count of students who scored >=90 in each subject: Count the number of students who scored 90 or more marks in each subject

Add a new row:

- . Take inputs from the user for the new row data (name, age).
- · Add the new row to the DataFrame.
- · Display the DataFrame after adding the new row.

Modify a row:

- · Modify a specific row by changing the age. Take the row index and new age value from the user.
- · Display the DataFrame after modifying the row.

Delete a row:

- Take the row index to be deleted from the user.
- · Remove the specified row.
- · Display the DataFrame after deleting the row.

Add a new column:

- · Add a column Gender with values taken from the user.
- · Display the DataFrame after adding the new column.

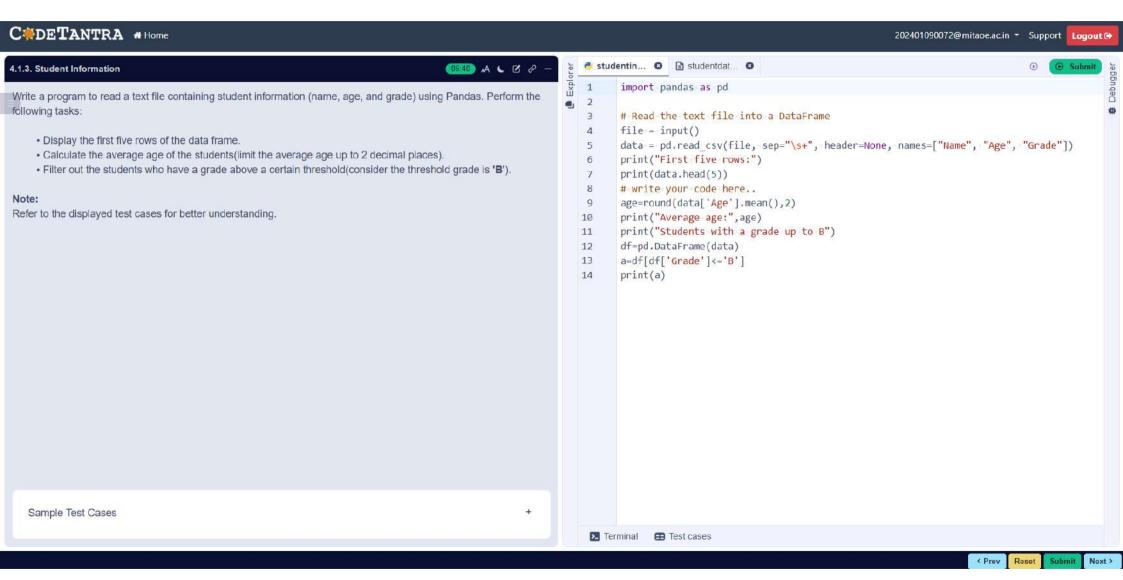

Modify a column:

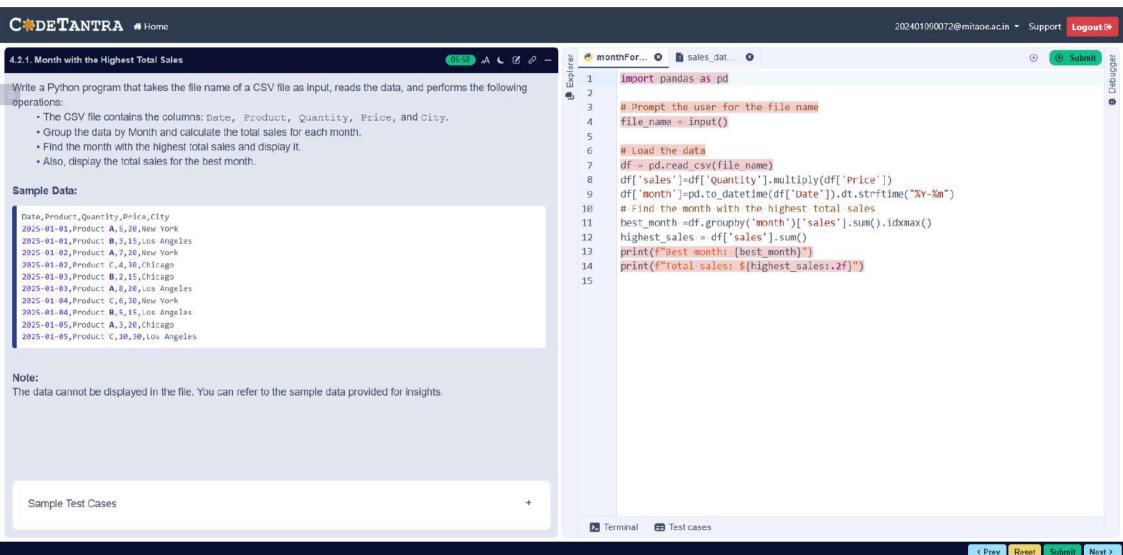

- · Convert names to uppercase.
- . Display the DataFrame after modifying the column

You are provided with the Titanic dataset containing information about passengers on the Titanic. Your task is to write Python code to answer the following questions based on the dataset. For each question, perform necessary data cleaning, transformations, and calculations as required.

- 1. Display the first 5 rows of the dataset.
- 2. Display the last 5 rows of the dataset.
- 3. Get the shape of the dataset (number of rows and columns).
- 4. Get a summary of the dataset (using .info()).
- 5. Get basic statistics (mean, standard deviation, etc.) of the dataset using .describe().
- 6. Check for missing values and display the count of missing values for each column.
- 7. Fill missing values in the 'Age' column with the median age.
- 8. Fill missing values in the 'Embarked' column with the most frequent value (mode).
- 9. Drop the 'Cabin' column due to many missing values.
- 10. Create a new column, 'FamilySize' by adding the 'SibSp' and 'Parch' columns.

The Titanic dataset contains columns as shown below.

Pass enger Id	Survi ved	Pclas s	Nam e	Sex	Age	SibS p	Parc h	Ticke t	Fare	Cabi n	Emb arked

Write a Python code to plot a histogram for the distribution of the 'Age' column from the Titanic dataset. The histogram should display the frequency of different age ranges with the following specifications:

- 1. Use 30 bins for the histogram.
- 2. Set the edge color of the bars to black (k).
- 3. Label the x-axis as 'Age' and the y-axis as 'Frequency'.
- 4. Add the title "Age Distribution" to the histogram.

The Titanic dataset contains columns as shown below.

Write a Python code to plot a boxplot that shows the distribution of the 'Fare' column from the Titanic dataset based on the passenger class (Pclass). The boxplot should display the following specifications:

- 1. Use the Pclass column to group the data for the boxplot.
- 2. Set the title of the plot to "Fare by Pclass".
- 3. Remove the default subtitle with plt.suptitle(").
- 4. Label the x-axis as 'Pclass' and the y-axis as 'Fare'.

The Titanic dataset contains columns as shown below.

Pass enger Id	Survi ved	Pclas s	Nam e	Sex	Age	SibS p	Parc h	Ticke t	Fare	Cabi n	Emb arked

Sample Data:

PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked 1,0,3,"Braund, Mr. Owen Harris", male, 22,1,0,A/5 21171,7.25,,5 2,1,1,"Cumings, Mrs. John Bradley (Florence Briggs Thayer)", female, 38,1,0,PC 17599,71.2833,C85,C 3,1,3,"Heikkinen, Miss. ■ Test cases

Write a Python code to plot a scatter plot showing the relationship between the 'Age' and 'Fare' columns in the Titanic dataset, with points color-coded by survival status. The scatter plot should display the following specifications:

- 1. Use the Age column for the x-axis and the Fare column for the y-axis.
- 2. Color the points based on the Survived column: Red for passengers who did not survive (Survived = 0). Blue for passengers who survived (Survived = 1).
- 3. Set the title of the plot to "Age vs. Fare by Survival".
- 4. Label the x-axis as 'Age' and the y-axis as 'Fare'.

The Titanic dataset contains columns as shown below.

Pass enger Id	Survi ved	Pclas s	Nam e	Sex	Age	SibS p	Parc h	Ticke t	Fare	Cabi n	Emb arked

Sample Data:

PassengerId, Survived, Polass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked 1,0,3, "Braund, Mr. Owen Harris", male, 22,1,0,A/5 21171,7.25,,5 2,1,1, "Cumings, Mrs. John Bradley (Florence Briggs Thayer)", female, 38,1,0,PC 17599,71.2833,C85,C 3,1,3,"Heikkinen, Miss.
